INTRODUCTION

QuickBite is a full-stack web application developed to streamline food ordering and inventory management. It enables users to browse food items, place orders, and manage their accounts, while administrators can manage food inventory, monitor stock levels, and handle orders efficiently. The system uses secure JWT-based authentication and role-based access control to ensure a reliable and user-friendly experience for both customers and administrators.

System Architecture

QuickBite follows a three-tier architecture where **React JS** provides the user interface, **Spring Boot** handles business logic through **REST APIs**, and **PostgreSQL** stores application data. This architecture ensures efficient communication, scalability, and secure data management.

FEATURES IMPLEMENTED

QuickBite provides secure user authentication and role-based access control using JWT. The system allows users to browse food items, search and filter menus by category, and place orders efficiently. Administrators can manage food items by adding, updating, or deleting menu entries, while also monitoring inventory levels and stock availability. The application streamlines food ordering and inventory management through a simple and user-friendly interface.

Technologies Used

Technology	Purpose
React JS	Frontend Development
Spring Boot	Backend Development
PostgreSQL	Database Management
JWT	Authentication & Authorization
REST API	Communication Between Frontend and Backend
Git & GitHub	Version Control and Collaboration
